merozoite surface protein-7 (MSP-2) of the asexual blood stage of plasmodium falciparum. It is used in the construction of recombinant protein CDC/NITMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melitin signal peptide, conficuence of the recombinant protein comprises, melitin signal peptide. CF from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (CSP), sporozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-15 (EBA-15), rhoper associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note="It contains two identical copies of a 32 AA unit

An antigen having the AA sequence in AAP80365 or an antigenic fragment thereof is claimed. Also claimed is a recombinant DNA molecule comprising all or a portion of a nuclectide sequence which is capable of being expressed as polypeptide having the antigenicity of the above antigen or an antigen fragment. Monoclonal antibodies produced using the antigens prevent release of merozoites into the Blood stream of an infected individual. The antigens can also be used for actively immunising a host against P. Talciparum. The antibodies can also be used for purificn. or detection of P. Falciparum.
                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                     .;

can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB1814 to AAB18352 represent nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The merozite surface antigen-2 may be used to generate Abs for detection and treatment of malaria, and in vaccination against the Plasmodium parasite. The isolate has conserved N- and C-terminal regions, but differs in central regions, sufficient that it may be see also AAR05876-9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Allelic variants of P falciparum merozoite surface antigen - used in prodn. of antibodies and in vaccines against malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes proteins and their fragments (I) encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag. T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmodium falloparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antigenic peptide fragment of MSA2 of P. falciparum Indochina 1 isolate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Recombinant vaccines against equine influenza virus – produced using DNA sequences encoding haemagglutinin and neuraminidase glycoprotein(s).
                                                                                H7 and N7 are virally encoded glycoproteins which confer the immunological characteristics of influenza virions. There are nine neuraminidase (RA) subtypes and twelve haemagalutinin (HA) subtypes. The strain carrying H7N7 glycoproteins is designated equine influenza virus (EVI).A1. The cDNA sequences encoding these will be useful in the construction of diagnostic probes for the disease and of probes for obtaining new cDNAs of the mutated form of the virus. Recombinant See also AAQ04596.Q04599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides derived from the haemagglutinin H7 and H3 and neuraminidase N7 and N8 genes may be used to derive antigenic peptides useful in vaccination against equine influenza virus infection. Abs raised to the peptides may be used in diagnosis of the infection and construction of probes to mutated forms of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preventing equine influenza virus infection - using recombinant vaccines produced using DNA sequences encoding haemagglutinin and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Equine influenza virus strain H7N7 (EIV-A1) neuraminidase N7 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAP70712 standard; protein; 470 AA.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Also described are: (I) nuclectice sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal artibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in infection, or they can be used to identify drug resistance in P. falciparum control of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the cumplexity of the parasite biology, a process hampered by the complexity of the parasite biology, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB1814 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                         falciparum; chromosome 2; human malaria parasite; vaccine;

The invention relates to olfactory receptors (AAC98432-AAC98609) and the genes encoding them (AAH83879-AAH84131) including pseudogenes of 10 primate species, mouse and human. The nucleic acids and receptors may be used in the food processing industry (e.g. for the detection of aromas, quality control and sample analysis), in perfumery (e.g. for the analysis or comparison of perfumes) and in the environment (e.g. for the detection of toxic substances and/or trapping of odours).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding primate and murine olfactory receptors, useful for analysis odours e.g. in food processing and perfumery -

The invention relates to olfactory receptors (AAG98432-AAG98609) and the genes encoding them (AAH83879-AAH84131) including pseudogenes of 10 primate species, mouse and human. The nucleic acids and receptors may be used in the food processing industry (e.g. for the detection of aromas, quality control and sample analysis), in perfumery (e.g. for the analysis or comparison of perfumes) and in the environment (e.g. for the detection of toxic substances and/or trapping of odours).
                                                                Nucleic acids encoding primate and murine olfactory receptors, useful for analysis odours e.g. in food processing and perfumery - \,
                                                                                                                                 Claim 3; Page 89-90; 482pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 4, Al

Patent No. 577296

GENERAL INFORMATION:
APPLICANT: ATKINSON, Antony
TITLE OF INVENTION: Pharmaceutical Compositions
TITLE OF INVENTION: Stearothermophilus and Bacillus Stearothermophilus and Bacillus COMPUTER READABLE FORM:
MUMBER OF SEQUENCES: 29

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   APPLICANT: Yue, Henry

A; Note: this enzyme exists as a tetramer in the viral membrane; the amino-terminal hy C; Comment: This enzyme catalyzes the cleavage of the terminal sialic acid (N-acetylne ing the carbohydrate residues from the viral envelope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 469

"Rapid evolution of the plastid translational apparatus in a nonphotosyythetic plant: loss or accelerated sequence evolution of tRNA and ribosomal protein genes.";
J. Mol. Evol. 35:304-317(1992).
-!- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 16S RIBOSOMAL RNA
                                                                                                                                  (BY SIMILARITY).
-!- SIMILARITY: CONTAINS 1 S4 RNA-BINDING DOMAIN.
-!- SIMILARITY: BELONGS TO THE S4P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   90.2%; Score 37; DB 1; Length 202; 100.0%; Pred. WO200011179-A1.
```

```
merozotte surface protein-2 (MSP-2) of the assual blood stage of Plasmodium falciparum. It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (MSP-1), MSP-2, apical membrane antigen-1, merozoite surface protein-1 antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1), msp. 2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="It contains two identical copies of a 32 AA unit arranged in tandem"

An antigen having the AA sequence in AAP80365 or an antigenic fragment thereof is claimed. Also claimed is a recombinant DNA molecule comprising all or a portion of a nuclectide sequence which is capable of being expressed as polypeptide having the antigenicity of the above antigen or an antigen fragment. Monoclonal antibodies produced using the antigens prevent release of merozoites into the blood stream of an infected individual. The antigens can also be used for actively immunising a host against P.falciparum. The antibodies can also be used for purificn. or detection of P.falciparum.
                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                  ;

Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins)

                                                                                                                                                                                                                   Gaps
                                                                            The merozite surface antigen-2 may be used to generate Abs for detection and treatment of malaria, and in vaccination against the Plasmodium parasite. The isolate has conserved N- and C-terminal regions, but differs in central regions, sufficient that it may be recognised by specific probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection -

can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide specifically mentioned within the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The merozite surface antigen-2 may be used to generate Abs for detection and treatment of malaria, and in vaccination against the Plasmodium parasite. The isolate has conserved N- and C-terminal regions, but differs in central regions, sufficient that it may be recognised by specific probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lelic variants of P falciparum merozoite surface antigen - used prodn. of antibodies and in vaccines against malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The merozite surface antigen-2 may be used to generate Abs for detection and treatment of malaria, and in vaccination against the Plasmodium parasite. The isolate has conserved N- and C-terminal regions, but differs in central regions, sufficient that it may be recognised by specific probes.
                                                                                     Merozite surface antigen-2 of the P.falciparum MAD71 isolate.

The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AAA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
